

Package ‘foldr’

May 31, 2013

Type Package

Version 0.1-1

Date 2013-05-29

Title A collection of Python-esque data types

Author Greg Lamp and Austin Ogilvie

Maintainer Greg Lamp <greg@yhathq.com>

Depends R (>= 2.12.0)

Imports plyr, digest

Description foldr provides Python-like data types (list and dict) in R

License FreeBSD

URL <https://github.com/yhat/foldr>

BugReports <https://github.com/yhat/foldr/issues>

Collate ‘pydict.R’ ‘pylist.R’ ‘utils.r’

R topics documented:

dict.py	2
dict_repl	2
encapsulate	2
list.py	3
merge.list	3
zip.dict	4
zip.tuple	4
Index	5

dict.py	<i>Creates an instance of a dict</i>
---------	--------------------------------------

Description

This is a wrapper function around the `pydict$new` that is a little more R friendly.

Usage

```
dict.py(...)
```

Arguments

... a series of key/value pairs in the form `key=value`

Examples

```
(x <- dict.py("a"=1, "b"=2, "c"=3))
#{a: 1, b: 2, c: 3}
```

dict_repl	<i>Function for representing hashed objects as strings</i>
-----------	------------------------------------------------------------

Description

Purely visual.

Usage

```
dict_repl(object, obj_name)
```

Arguments

object	an arbitrary thing
obj_name	name of the variable as defined by the user (not currently being used)

encapsulate	<i>Helper function for making character vectors have quotes around each item when printed to the console.</i>
-------------	---------------------------------------------------------------------------------------------------------------

Description

Helper function for making character vectors have quotes around each item when printed to the console.

Usage

```
encapsulate(values)
```

Arguments

values	a vector of values
--------	--------------------

list.py	<i>Creates an instance of a list</i>
---------	--------------------------------------

Description

This is a wrapper function around the `pylist$new` that is a little more R friendly.

Usage

```
list.py(...)
```

Arguments

...	a series of values seperated by a comma. NOTE: a vector will be treated as an individual item. i.e. <code>list.py(1:100)</code> will yield a list with 1 item, whereas <code>list.py(1, 2, 3, 4)</code> will yield a list with 4 items
-----	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

Examples

```
x <- list.py(1, 2, 3, 4)
#[1, 2, 3, 4]
```

merge.list	<i>Function that takes 2 lists and merges them fairly effeciently</i>
------------	-----------------------------------------------------------------------

Description

Function that takes 2 lists and merges them fairly effeciently

Usage

```
merge.list(x, y = NULL, mergeUnnamed = TRUE, ...)
```

Arguments

x	a list
y	a second list

zip.dict	Combine 2 lists into a dict of key/values
----------	-------------------------------------------

Description

Takes 2 lists and converts them into a key => value mapping, which takes the form of a [dict](#).

Usage

```
zip.dict(x, y)
```

Arguments

x	a list, vector, or list.py
y	a second list, vector, or list.py

Examples

```
x <- list.py(1, 2, 3)
y <- list.py("a", "b", "c")
zip.dict(x, y)
#{1: 'a', 2: 'b', 3: 'c'}
zip.dict(y, x)
#{'a': 1, 'b': 2, 'c': 3}
```

zip.tuple	Combine 2 lists into a list of lists
-----------	--------------------------------------

Description

Return a list of 2 item lists, where each list contains the i-th element from each of the argument sequences. The returned list is truncated in length to the length of the shortest argument sequence.

Usage

```
zip.tuple(x, y)
```

Arguments

x	a list, vector, or list.py
y	a second list, vector, or list.py

Examples

```
x <- list.py(1, 2, 3)
y <- list.py(4, 5, 6)
zip.tuple(x, y)
#[[1, 4], [2, 5], [3, 6]]
y <- list.py("a", "b", "c")
zip.tuple(x, y)
#[[1, 'a'], [2, 'b'], [3, 'c']]
```
